## **Neural Network Basics**

LATEST SUBMISSION GRADE

1	$\cap$	0%	
	u	U%0	

1. What does a neuron compute?

1 / 1 point

- $\bigcirc\hspace{0.1cm}$  A neuron computes the mean of all features before applying the output to an activation function
- A neuron computes an activation function followed by a linear function (z = Wx + b)
- $\bigcirc$  A neuron computes a function g that scales the input x linearly (Wx + b)
- A neuron computes a linear function (z = Wx + b) followed by an activation function

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

2. Which of these is the "Logistic Loss"?

1 / 1 point

- $\bigcirc \hspace{0.5cm} \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)} \log(\hat{y}^{(i)}) + (1 y^{(i)}) \log(1 \hat{y}^{(i)}))$
- $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} \hat{y}^{(i)})$
- $\bigcirc \ \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid^2$
- $\bigcirc \ \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid$

Correct, this is the logistic loss you've seen in lecture!

3. Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

1 / 1 point

- x = img.reshape((1,32\*32,\*3))
- x = img.reshape((32\*32\*3,1))
- x = img.reshape((32\*32,3))
- x = img.reshape((3,32\*32))

✓ Correct

4. Consider the two following random arrays "a" and "b":

1 / 1 point

What will be the shape of "c"?

- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- c.shape = (2, 3)
- c.shape = (2, 1)
- c.shape = (3, 2)

✓ Correct

Yes! This is broadcasting, b (column vector) is copied 3 times so that it can be summed to each column of a.

5.	Consider the two following random arrays "a" and "b":	1 / 1 point
	1 a = np.randon.randn(4, 3) # a.shape = (4, 3) 2 b = np.randon.randn(3, 2) # b.shape = (3, 2) 3 c = a*b	
	What will be the shape of "c"?	
	c.shape = (4,2) c.shape = (3, 3) The computation cannot happen because the sizes don't match. It's going to be "Error"! c.shape = (4, 3)	
	Correct Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).	
6.	Suppose you have $n_x$ input features per example. Recall that $X=[x^{(1)}x^{(2)}x^{(m)}]$ . What is the dimension of X?	1/1 point
	$ \bigcirc (m, n_x) $ $ \bigcirc (1, m) $ $ \bigcirc (m, 1) $ $ \circledcirc (n_x, m) $	
	✓ Correct	
7.	Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-wise multiplication.  Consider the two following random arrays "a" and "b":  1 a = np.random.randn(12288, 156) # a.shape = (12288, 156) 2 b = np.random.randn(1108, 45) # b.shape = (156, 45)	1/1 point
	What is the shape of c?  c.shape = (12288, 150)  The computation cannot happen because the sizes don't match. It's going to be "Error"!  c.shape = (150,150)  c.shape = (12288, 45)	
	Correct Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because: "number of columns of a = 150 = number of rows of b"	
8.	Consider the following code snippet:  1  # a.shape = (3,4) 2  # b.shape = (4,1) 3  4 * for 1 tn range(3): 5 * for 1 tn range(4): 6  cfilfil = afilfil + bfill	1/1 point
	How do you vectorize this?  c = a.T + b.T  c = a + b  c = a + b.T  c = a.T + b	
	✓ Correct	

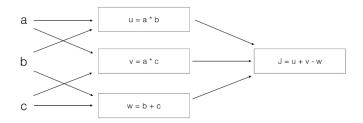

9. Consider the following code:

What will be c? (If you're not sure, feel free to run this in python to find out).

- $\odot$  This will invoke broadcasting, so b is copied three times to become (3,3), and \* is an element-wise product so c.shape will be (3, 3)
- This will invoke broadcasting, so b is copied three times to become (3, 3), and \* invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "\*" to operate on these two matrices. You need to instead use np.dot(a,b)

10. Consider the following computation graph.

What is the output J?

- J = (c 1)\*(b + a)
- J = (a 1) \* (b + c)
- ) = a\*b + b\*c + a\*c
- ∫ = (b 1) \* (c + a)

Yes. J = u + v - w = a\*b + a\*c - (b + c) = a\*(b + c) - (b + c) = (a - 1)\*(b + c).
