1. Suppose your training examples are sentences (sequences of words). Which of the following refers to the j^{th} word in the i^{th} training example?

1/1 point

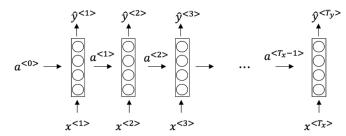

- $\bigcirc \hspace{0.1in} x^{(i) < j >}$
- $\bigcirc \ x^{< i > (j)}$
- $\bigcirc x^{(j) < i >}$
- $\bigcirc \ x^{< j > (i)}$

✓ Correct

We index into the i^{th} row first to get the i^{th} training example (represented by parentheses), then the j^{th} column to get the j^{th} word (represented by the brackets).

2. Consider this RNN:

1 / 1 point

This specific type of architecture is appropriate when:

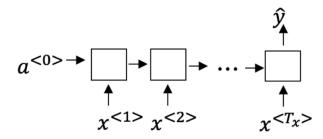

- \bigcirc $T_x = T_y$
- $\bigcap T_x < T_y$
- $\bigcap T_x > T_y$
- $\bigcap T_x = 1$

✓ Correct

It is appropriate when every input should be matched to an output.

3. To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply).

1 / 1 point

- $\hfill \square$ Speech recognition (input an audio clip and output a transcript)
- Sentiment classification (input a piece of text and output a 0/1 to denote positive or negative sentiment)

✓ Correct

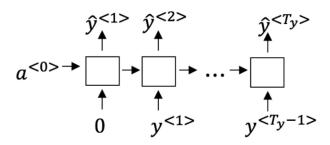

Correct!

Image classification (input an image and output a label)

Gender recognition from speech (input an audio clip and output a label indicating the speaker's gender)

Correct
Correct!

4. You are training this RNN language model.

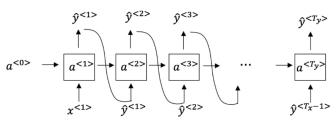

At the t^{th} time step, what is the RNN doing? Choose the best answer.

- $\bigcirc \ \ \operatorname{Estimating} P\big(y^{<1>},y^{<2>},\dots,y^{< t-1>}\big)$
- $\bigcirc \ \ \operatorname{Estimating} P\big(y^{< t>}\big)$
- $\bigcirc \ \, \mathsf{Estimating} \, P\big(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \ldots, y^{< t>} \big)$

✓ Correct

Yes, in a language model we try to predict the next step based on the knowledge of all prior steps.

5. You have finished training a language model RNN and are using it to sample random sentences, as follows:

What are you doing at each time step t?

- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{<\!\!\!>}$. (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass this selected word to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass this selected word to the next time-step.

✓ Correct Yes!

6. You are training an RNN, and find that your weights and activations are all taking on the value of NaN ("Not a Number"). Which of these is the most likely cause of this problem?

1 / 1 point

1 / 1 point

1 / 1 point

Vanishing gradient problem.

- Exploding gradient problem.
- ReLU activation function g(.) used to compute g(z), where z is too large.
- Sigmoid activation function g(.) used to compute g(z), where z is too large.

0 1

100

300

0 10000

✓ Correct

Correct, Γ_u is a vector of dimension equal to the number of hidden units in the LSTM.

8. Here're the update equations for the GRU.

 $a^{< t>} = c^{< t>}$

1 / 1 point

GRU

$$\begin{split} \tilde{c}^{< t>} &= \tanh(W_c[\Gamma_r * c^{< t-1>}, x^{< t>}] + b_c) \\ \Gamma_u &= \sigma(W_u[\ c^{< t-1>}, x^{< t>}] + b_u) \\ \Gamma_r &= \sigma(W_r[\ c^{< t-1>}, x^{< t>}] + b_r) \\ \\ c^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + (1 - \Gamma_u) * c^{< t-1>} \end{split}$$

Alice proposes to simplify the GRU by always removing the Γ_u . I.e., setting Γ_u = 1. Betty proposes to simplify the GRU by removing the Γ_r . I. e., setting Γ_r = 1 always. Which of these models is more likely to work without vanishing gradient problems even when trained on very long input sequences?

- \bigcirc Alice's model (removing Γ_u), because if $\Gamma_r \approx 0$ for a timestep, the gradient can propagate back through that timestep without much decay.
- \bigcirc Alice's model (removing Γ_u), because if $\Gamma_r \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.
- 0 Betty's model (removing Γ_r), because if $\Gamma_u \approx 0$ for a timestep, the gradient can propagate back through that timestep without much decay.
- \bigcirc Betty's model (removing Γ_r), because if $\Gamma_u \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.

✓ Correct

Yes. For the signal to backpropagate without vanishing, we need $c^{< t>}$ to be highly dependant on $c^{< t-1>}$

LSTM

9. Here are the equations for the GRU and the LSTM:

1 / 1 point

GRU

$$\begin{split} \tilde{c}^{< t>} &= \tanh(W_c [\Gamma_r * c^{< t-1>}, x^{< t>}] + b_c) \\ \Gamma_u &= \sigma(W_u [\, c^{< t-1>}, x^{< t>}] + b_u) \\ \Gamma_r &= \sigma(W_u [\, c^{< t-1>}, x^{< t>}] + b_u) \\ \Gamma_r &= \sigma(W_r [\, c^{< t-1>}, x^{< t>}] + b_r) \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + (1 - \Gamma_u) * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t>} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * c^{< t-1>} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * \tilde{c}^{< t} + \Gamma_f * \tilde{c}^{< t} + \Gamma_f * \tilde{c}^{< t} \\ C^{< t} &= \Gamma_u * \tilde{c}^{< t} + \Gamma_f * \tilde{c}^{< t$$

From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to _____ and ____ in the GRU. What should go in the the blanks?

 $\bigcap \ \Gamma_u$ and Γ_r

 $\bigcirc \ 1 - \Gamma_u$ and Γ_u

 \bigcap Γ_r and Γ_u

✓ Correct

Yes, correct!

10. You have a pet dog whose mood is heavily dependent on the current and past few days' weather. You've collected data for the past 365 days on the weather, which you represent as a sequence as x^{<1>},..., x^{<365>}. You've also collected data on your dog's mood, which you represent as y^{<1>},..., y^{<365>}. You'd like to build a model to map from x → y. Should you use a Unidirectional RNN or Bidirectional RNN for this problem?
Bidirectional RNN, because this allows the prediction of mood on day t to take into account more information.
Bidirectional RNN, because this allows backpropagation to compute more accurate gradients.
Unidirectional RNN, because the value of y^{<t>} depends only on x^{<1>},..., x^{<t>}, but not on x^{<t+1>},..., x^{<365>}
Unidirectional RNN, because the value of y^{<t>} depends only on x^{<t>}, and not other days' weather.

Yes!
